Asigra.

Datasheet

Five Best Kept Secrets on How Asigra Uniquely Defeats Ransomware

Asigra prevents ransomware…

1 …infections (i.e. before encryption has begun) from being backed up while isolating and identifying the infected files.

(What's your process for ensuring your backups are not infected with ransomware?)

2 …infections that may be in older backups from being recovered and reinfecting those systems while isolating and identifying the infected files.

(What's your process for ensuring your recoveries don't re-infect your production systems with ransomware?)

3 …from encrypting if they have not already detonated by empowering administrators to delete infected files from primary systems preventing their detonation then recovering from a non-infected backup.

(What's your process for identifying infected files in your production systems before they detonate?)

4 …from deleting backups with multi-factor authentication or via the renaming of backups.

What's your process for ensuring your backups aren't deleted by ransomware?

5 …from exploiting human vulnerability by eliminating backup passwords frequently forgotten or too easy to guess with biometric multi-factor authentication.

What's your process for ensuring your backups aren't accessed by ransomware?

What are your processes for ensuring your backups are secure?
